Lincoln

Immigration cases, worked before anyone asks.

In one page

Lincoln runs immigration cases for US law firms. The attorney only makes the decisions.

What

Lincoln reads the firm's mail, opens and works each case, chases what is missing and drafts the next step.

Why

Immigration work is high volume, paper heavy and run on deadlines. Most of the hours go on reading, chasing and drafting.

Status

A working product, built and tested on public documents and made up cases. First firms on real cases next.

Raising

$1.5M to put Lincoln to work in 50 firms and pass a SOC 2 audit within 18 months.

The problem

Every immigration case is the same three jobs, done by hand.

Read every document and check every name and date against every other. Chase the client for what is missing. Draft letters and filings that cite the evidence page by page. A missed date can cost a client their status.

11.3M

cases pending at USCIS in early 2025, the most in at least a decade.

16,000+

attorneys in AILA, the US immigration bar, each with paralegals and staff.

$29.70

an hour, the median paralegal wage in legal services. Attorney time costs more.

Sources: USCIS quarterly data as reported by the American Immigration Council (Q2 FY2025); AILA 2026 media kit; US Bureau of Labor Statistics, paralegals in legal services, median annual wage $61,770.

What firms use today

Today's software waits to be asked.

Case management

Docketwise, INSZoom, LollyLaw. They store the file and fill the forms. A person still reads every page, chases the client and drafts the letters.

AI assistants

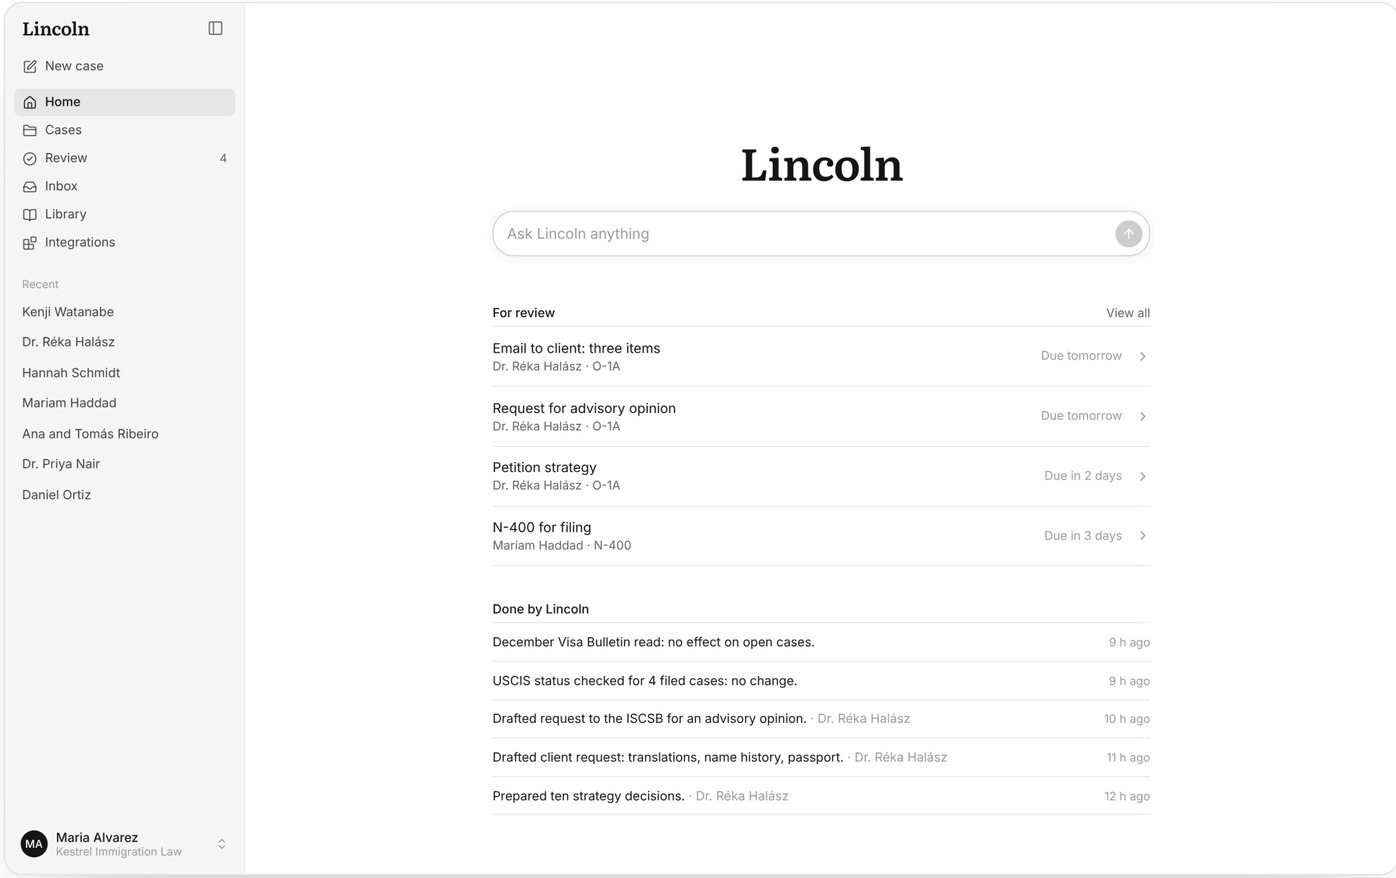

Harvey, Legora, ChatGPT. They answer when prompted. A person still has to notice the work, upload the file and ask the right question.

Lincoln starts when the email arrives.

The product

Lincoln works the case. The attorney decides.

Home shows two things: what is waiting for a decision, and what Lincoln has already done. Nothing else needs managing.

Sample workspace. Every client and case shown is made up.

How it works

From the inbox to a decision, without anyone starting it.

01

Reads the mail

Every email is sorted: a new matter, a case update, a government notice or noise. Newsletters never reach the model.

02

Opens and reads the case

Every page of every attachment, scans and phone photos included. Each fact is tied to the page it came from.

03

Prepares the next step

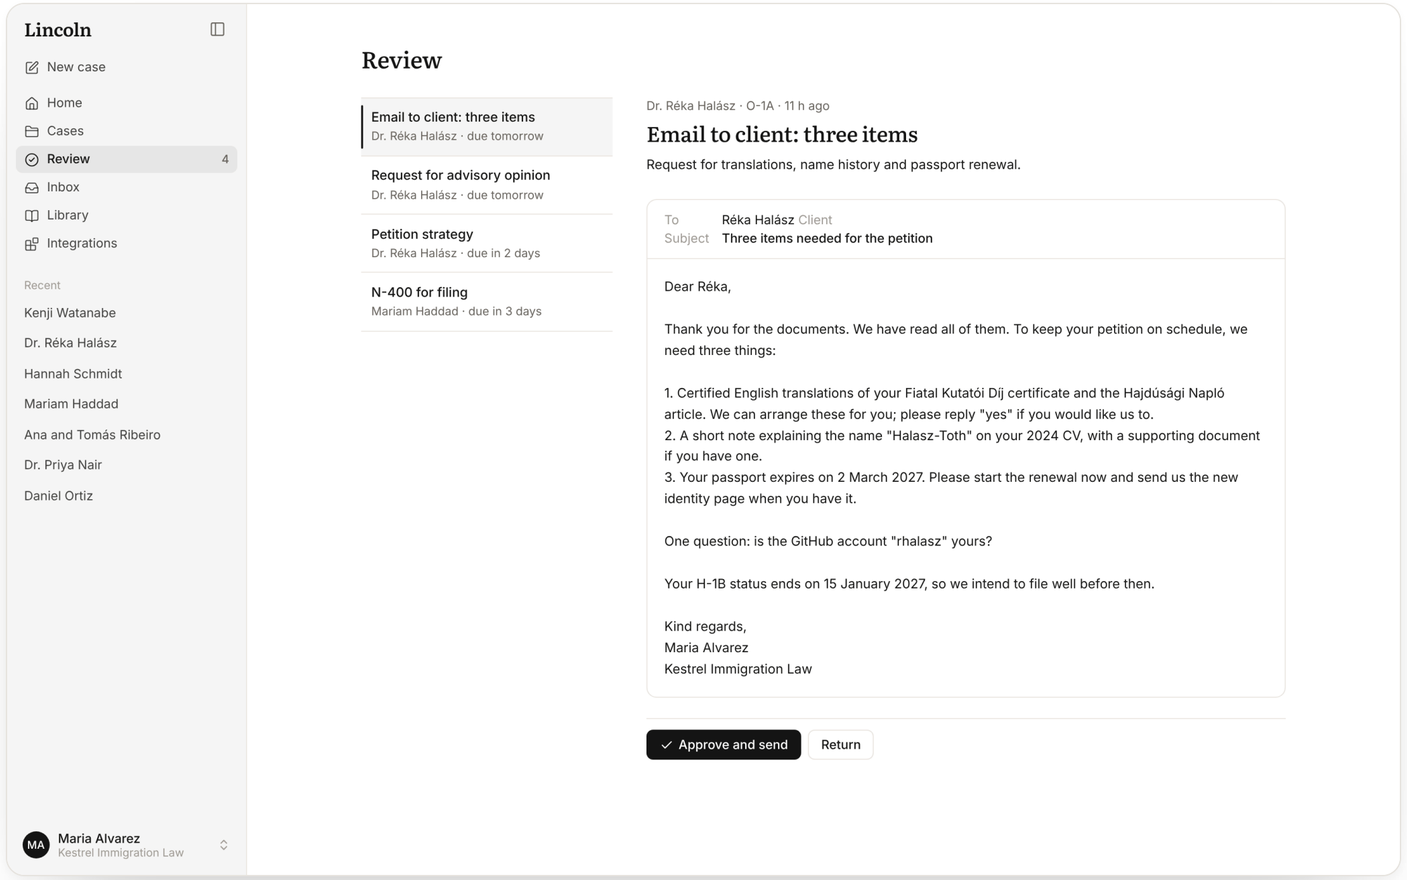

Issues, deadlines, requests to the client, letters and filings, drafted for the attorney's review.

04

Asks for the decision

The attorney approves, edits or returns it. Approved mail goes out from the firm's own mailbox.

A case that arrives another way (a call, a walk in) is one sentence or a few files typed into Lincoln. It does the rest the same way.

Sample workspace. Every client and case shown is made up.

Review

Nothing leaves the firm without an attorney's approval.

Lincoln read the client's file, found three gaps and wrote to her about them. The attorney reads it once and sends it.

Trust

Built for lawyers who check.

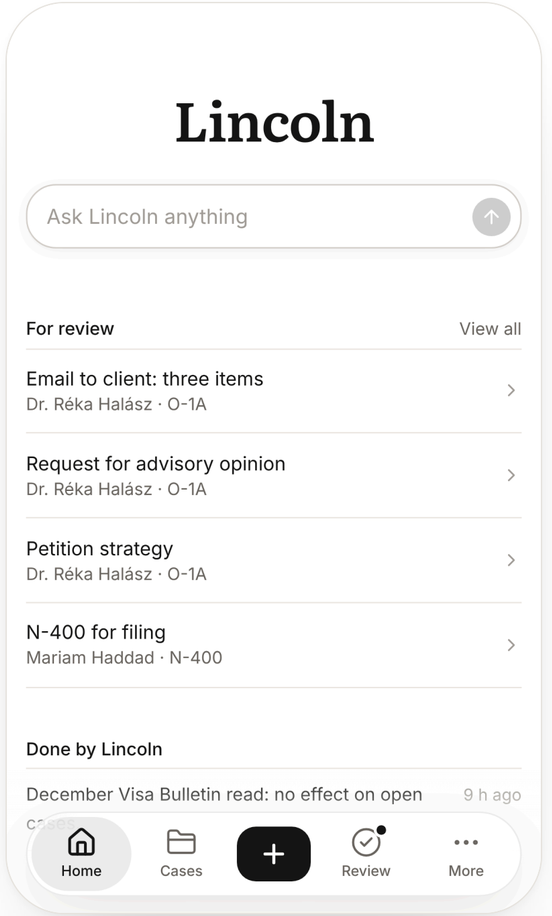

Every fact cites its page. Point at a sentence and the page it came from opens.

No guessing. A page that cannot be read with certainty is flagged and never used.

Approval first. Nothing reaches a client or the government until an attorney says so.

Each firm's files are encrypted with their own key. Two step sign in, a device list and a security log.

Works where the firm works. Gmail, Outlook, Drive, OneDrive, Word, Excel, PowerPoint, Teams and Calendar.

On a phone. Made up cases.

Why now

The models can do the work, and lawyers are already paying for AI.

The work is now possible

Models can read scanned and photographed documents and keep a citation for every fact across a long file.

The spend is proven

Legal tech raised a record $4.6B in 2025. Harvey is reported at $15.5B and Legora at $8.8B, both selling AI that waits for a prompt.

The category is moving

"2027 will be the year of autonomous software." Ryan Anderson, chief executive of Filevine, October 2026. The firm that owns autonomy in immigration has not been decided.

Sources: Crunchbase (2025 legal tech funding); reported valuations, Harvey September 2026 and Legora October 2026; Filevine at LEX Summit, 30 October 2026.

Business model

Priced against the hours it saves, not against other software.

$300

a seat a month, the working price. Unlimited cases. To be tested with the first firms.

10 h

of paralegal time a month pays for a seat at the median wage. Lincoln is built to save many times that.

$3.6M

a year for every 1,000 seats. One seat for each AILA attorney alone is about $58M a year, before paralegals and staff.

Immigration is the first market. The same engine fits any practice that runs on documents, clients and government deadlines.

Where Lincoln sits

Others help with a step. Lincoln works the whole case.

Harvey, Legora	General legal AI for large firms and in house teams. Work starts with a prompt.
Clio, Filevine	Practice management adding agents. Broad, not built around immigration.
Docketwise, INSZoom, LollyLaw	Immigration case management and forms.
Parley, Visalaw.ai, CaseBlink	Drafting help for specific steps and visa types.
ICM Desk	Case agents per visa type. The closest model found; early.
Lincoln	Every immigration case type, worked from the firm's own inbox, with an attorney approving every step.

Go to market

A firm finds it, signs in, and it starts on the next email.

One step to start

Sign in with Google or Microsoft and the mailbox is connected. No setup project, no migration before the first result.

Found, not sold

Search, legal software directories and company content. Small and mid sized firms sign up on their own, without a sales call.

Grows with the firm

Seats follow the caseload. Every case type is covered from the first day, so the first seat is not the last.

Where it stands

The product is built. Real firms are next.

Built and tested

- Mail sorted and cases opened from Gmail and Outlook
- Files of any length read, scans and phone photos included
- Issues, dates and evidence graded page by page
- Drafts with page citations, exported to Word, Excel, PowerPoint
- Approval queue, sending from the firm's own mailbox

Next 90 days

- Security minimum for real client files
- Zero retention agreement with the model provider
- First firms working real cases
- Client upload link and questionnaire
- Lincoln inside Word

No revenue yet. Every test so far has used public documents, made up cases and test versions of the mail services.

The round

Raising $1.5M.

Use of funds

Engineering	50%
Security and compliance	20%
Attorney review and case quality	15%
Growth	15%

Targets for the next 18 months

- 50 firms working real cases in Lincoln
- 300 paying seats, about $1.1M a year
- SOC 2 Type I and an independent penetration test
- Every major immigration case type proven on real files

Team

A founder who ships, and the next hires the money pays for.

Ismael, founder

Designed and shipped Lincoln: the product, the case engine, the Google and Microsoft integrations and the security.

Founding engineer

First hire from the round, to scale the case engine and the integrations.

Immigration attorney

Reviews Lincoln's work on every case type and sets the standard it is held to.

Lincoln

Every case worked. Every decision the attorney's.
